

## ECE297:11 Lecture 12

### RSA – Genesis, operation & security

---

---

---

---

---

---

---

---

### Public Key (Asymmetric) Cryptosystems

Public key of Bob -  $K_B$

Private key of Bob -  $k_B$

---

---

---

---

---

---

---

---

### Trap-door one-way function

Whitfield Diffie and Martin Hellman  
"New directions in cryptography," 1976

---

---

---

---

---

---

---

---

**Professional (NSA) vs. amateur (academic) approach to designing ciphers**

- |   |  |
|---|--|
| 1. Know how to break Russian ciphers        | 1. Know nothing about cryptology               |
| 2. Use only well-established proven methods | 2. Think of revolutionary ideas                |
| 3. Hire 50,000 mathematicians               | 3. Go for skiing                               |
| 4. Cooperate with an industry giant         | 4. Publish in "Scientific American"            |
| 5. Keep as much as possible secret          | 5. Offer a \$100 award for breaking the cipher |

---

---

---

---

---

---

---

---

**Challenge published in Scientific American**

**Ciphertext:** 1977

*Award 100 \$*

---

---

---

---

---

---

---

---

**RSA as a trap-door one-way function**

---

---

---

---

---

---

---

---

**RSA keys**

**PUBLIC KEY**                      **PRIVATE KEY**

$\{ e, N \}$      $\xleftrightarrow{\hspace{1cm}}$      $\{ d, P, Q \}$   
 ~~$\xrightarrow{\hspace{1cm}}$~~

$N = P \cdot Q$        $P, Q$  - large prime numbers  
 $e \cdot d \equiv 1 \pmod{(P-1)(Q-1)}$

---

---

---

---

---

---

---

---

**Why does RSA work? (1)**

$M' = C^d \pmod N = (M^e \pmod N)^d \pmod N \stackrel{?}{=} M$   
 decrypted message                      original message

$e \cdot d \equiv 1 \pmod{(P-1)(Q-1)}$

$\Downarrow$   
 $e \cdot d \equiv 1 \pmod{\phi(N)}$   
 Euler's totient function

---

---

---

---

---

---

---

---

**Euler's totient (phi) function (1)**

$\phi(N)$  - number of integers in the range from 1 to N-1 that are relatively prime with N

Special cases:

1. P is prime  
 $\phi(P) = P-1$

Relatively prime with P: 1, 2, 3, ..., P-1

2.  $N = P \cdot Q$     P, Q are prime  
 $\phi(N) = (P-1) \cdot (Q-1)$

Relatively prime with N: {1, 2, 3, ..., P-Q-1} - {P, 2P, 3P, ..., (Q-1)P} - {Q, 2Q, 3Q, ..., (P-1)Q}

---

---

---

---

---

---

---

---

### Euler's totient (phi) function (2)

Special cases:

3.  $N = P^2$   $P$  is prime

$$\varphi(N) = P \cdot (P-1)$$

Relatively prime with  $N$ :  $\{1, 2, 3, \dots, P^2-1\} - \{P, 2P, 3P, \dots, (P-1)P\}$

**In general**

If  $N = P_1^{e_1} \cdot P_2^{e_2} \cdot P_3^{e_3} \cdot \dots \cdot P_t^{e_t}$

$$\varphi(N) = \prod_{i=1}^t P_i^{e_i-1} \cdot (P_i-1)$$

---

---

---

---

---

---

---

---

### Euler's Theorem

*Leonard Euler, 1707-1783*

$$\forall a: \gcd(a, N) = 1 \quad a^{\varphi(N)} \equiv 1 \pmod{N}$$

---

---

---

---

---

---

---

---

### Euler's Theorem - Justification (1)

**For  $N=10$**

$$R = \{1, 3, 7, 9\}$$

Let  $a=3$

$$S = \{3 \cdot 1 \pmod{10}, 3 \cdot 3 \pmod{10}, 3 \cdot 7 \pmod{10}, 3 \cdot 9 \pmod{10}\} \\ = \{3, 9, 1, 7\}$$

**For arbitrary  $N$**

$$R = \{x_1, x_2, \dots, x_{\varphi(N)}\}$$

Let us choose arbitrary  $a$ , such that  $\gcd(a, N) = 1$

$$S = \{a \cdot x_1 \pmod{N}, a \cdot x_2 \pmod{N}, \dots, a \cdot x_{\varphi(N)} \pmod{N}\} \\ = \text{rearranged set } R$$

---

---

---

---

---

---

---

---

**Euler's Theorem - Justification (2)**

**For N=10**

$$R = S$$

$$x_1 \cdot x_2 \cdot x_3 \cdot x_4 \equiv (a \cdot x_1) \cdot (a \cdot x_2) \cdot (a \cdot x_3) \cdot (a \cdot x_4) \pmod{N}$$

$$x_1 \cdot x_2 \cdot x_3 \cdot x_4 \equiv a^4 \cdot x_1 \cdot x_2 \cdot x_3 \cdot x_4 \pmod{N}$$

$$a^4 \equiv 1 \pmod{N}$$

**For arbitrary N**

$$R = S$$

$$\prod_{i=1}^{\phi(N)} x_i \equiv \prod_{i=1}^{\phi(N)} a \cdot x_i \pmod{N}$$

$$\prod_{i=1}^{\phi(N)} x_i \equiv a^{\phi(N)} \cdot \prod_{i=1}^{\phi(N)} x_i \pmod{N}$$

$$a^{\phi(N)} \equiv 1 \pmod{N}$$

---

---

---

---

---

---

---

---

**Why does RSA work? (2)**

$$\begin{aligned} M' &= C^d \pmod{N} = (M^e \pmod{N})^d \pmod{N} = \\ &= M^{e \cdot d} \pmod{N} = \left| \begin{array}{l} e \cdot d \equiv 1 \pmod{\phi(N)} \\ e \cdot d = 1 + k \cdot \phi(N) \end{array} \right| = \\ &= M^{1+k \cdot \phi(N)} \pmod{N} = M \cdot (M^{\phi(N)})^k \pmod{N} = \\ &= M \cdot (M^{\phi(N)} \pmod{N})^k \pmod{N} = \\ &= M \cdot 1^k \pmod{N} = M \end{aligned}$$

---

---

---

---

---

---

---

---

**Rivest estimation - 1977**

The best known algorithm for factoring a 129-digit number requires:

**40 000 trillion years**  
=  $40 \cdot 10^{15}$  years

assuming the use of a supercomputer being able to perform

1 multiplication of 129 decimal digit numbers in 1 ns

*Rivest's assumption translates to the delay of a single logic gate  $\approx 10$  ps*

**Estimated age of the universe: 100 bln years =  $10^{11}$  years**

---

---

---

---

---

---

---

---

<b>Early records in factoring large numbers</b>			
<b>Years</b>	<b>Number of decimal digits</b>	<b>Number of bits</b>	<b>Required computational power (in MIPS-years)</b>
1974	45	149	0.001
1984	71	235	0.1
1991	100	332	7
1992	110	365	75
1993	120	398	830

### Breaking RSA-129

**When:** August 1993 - 1 April 1994, **8 months**  
**Who:** D. Atkins, M. Graff, A. K. Lenstra, P. Leyland  
+ 600 volunteers from the entire world  
**How:** **1600 computers**  
from Cray C90, through 16 MHz PC,  
to fax machines

*Only 0.03% computational power of the Internet*

**Results of cryptanalysis:**

*“The magic words are squeamish ossifrage”*

An award of 100 \$ donated to Free Software Foundation

---

---

---

---

---

---

---

---

### Elements affecting the progress in factoring large numbers

- computational power  
1977-1993 increase of about 1500 times
- computer networks  
Internet
- better algorithms

---

---

---

---

---

---

---

---

### Factoring methods

#### General purpose

*Time of factoring depends  
only on the size of  $N$*

GNFS - General Number  
Field Sieve  
QS - Quadratic Sieve  
Continued Fraction Method  
*(historical)*

#### Special purpose

*Time of factoring is much  
shorter if  $N$  or factors of  $N$   
are of the special form*

ECM - Elliptic Curve Method  
Pollard's p-1 method  
Cyclotomic polynomial method  
SNFS - Special Number Field  
Sieve

---

---

---

---

---

---

---

---

### Running time of factoring algorithms

$$L_q[\alpha, c] = \exp((c+o(1)) \cdot (\ln q)^\alpha \cdot (\ln \ln q)^{1-\alpha})$$

For  $\alpha=0$

$$L_q[0, c] = (\ln q)^{c+o(1)}$$

Algorithm **polynomial**  
as a function of the number  
of bits of  $q$

For  $\alpha=1$

$$L_q[1, c] = \exp((c+o(1)) \cdot (\ln q))$$

Algorithm **exponential**  
as a function of the number  
of bits of  $q$

For  $0 < \alpha < 1$

Algorithm **subexponential**  
as a function of the number  
of bits of  $q$

$f(n) = o(1)$  if for any positive constant  $c > 0$  there exist a constant  $n_0 > 0$ , such that  $0 \leq f(n) < c$ , for all  $n \geq n_0$

---

---

---

---

---

---

---

---

### General purpose factoring methods

*Expected running time*

QS

NFS

$$L_N[1/2, 1] = \exp((1 + o(1)) \cdot (\ln N)^{1/2}) \cdot (\ln \ln N)^{1/2}$$

$$L_N[1/3, 1.92] = \exp((1.92 + o(1)) \cdot (\ln N)^{1/3}) \cdot (\ln \ln N)^{2/3}$$

---

---

---

---

---

---

---

---

### RSA Challenge

- RSA-100
- RSA-110
- RSA-120
- RSA-130
- RSA-140
- RSA-150
- RSA-160
- RSA-170
- RSA-180
- .....
- RSA-450
- RSA-460
- RSA-470
- RSA-480
- RSA-490
- RSA-500

Smallest unfactored number

**RSA-150**

Unused awards accumulate at a rate  
of \$1750 / quarter

---

---

---

---

---

---

---

---

**Factoring 512-bit number**

**512 bits = 155 decimal digits**  
**old standard for key sizes in RSA**

*17 March - 22 August 1999*

Group of Herman te Riele  
 Centre for Mathematics and Computer Science  
 (CWI), Amsterdam

First stage      2 months  
 168 workstations SGI and Sun, 175-400 MHz  
 120 Pentium PC, 300-450 MHz, 64 MB RAM  
 4 stations Digital/Compaq, 500 MHz

Second stage  
 Cray C916 - 10 days, 2.3 GB RAM

---

---

---

---

---

---

---

---

**TWINKLE**  
**“The Weizmann Institute Key Locating Engine”**

*Adi Shamir, Eurocrypt, May 1999*  
*CHES, August 1999*

**Electrooptical device capable to speed-up  
 the first phase of factorization from 100 to 1000 times**

**If ever built it would increase the size of the key  
 that can be broken from 100 to 200 bits**

**Cost of the device (assuming that the prototype was  
 earlier built) - \$5000**

---

---

---

---

---

---

---

---

**Recommended key sizes for RSA**

<b>Old standard:</b>	
Individual users	<del>512 bits</del> (155 decimal digits)
<b>New standard:</b>	
Individual users	<b>768 bits</b> (231 decimal digits)
Organizations (short term)	<b>1024 bits</b> (308 decimal digits)
Organizations (long term)	<b>2048 bits</b> (616 decimal digits)

---

---

---

**RSA vs. DES: Resistance to attack**

Number of operations in the best known attack

---

---

---

---

---

---

---

---

**Keylengths in RSA providing the same level of security as selected secret-key cryptosystems**

---

---

---

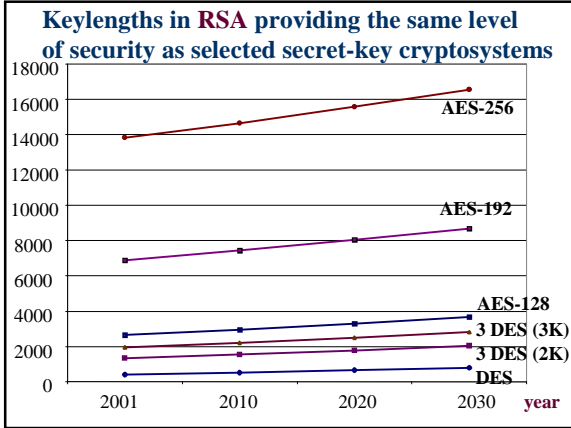

---

---

---

---

---

---

---

---

---

---

---

---

---

**Practical progress in factorization**

**March 2002, Financial Cryptography Conference**

**Nicko van Someren, CTO nCipher Inc.**  
announced that his company developed software capable of breaking 512-bit RSA key within **6 weeks** using computers available in a single office

---

---

---

---

---

---

---

---

**Bernstein's Machine (1)**

**Fall 2001**

**Daniel Bernstein**, professor of mathematics at University of Illinois in Chicago submits a grant application to NSF and publishes fragments of this application as an article on the web

D. Bernstein, *Circuits for Integer Factorization: A Proposal*  
<http://cr.yp.to/papers.html#nfsccircuit>

---

---

---

---

---

---

---

---

### Bernstein's Machine (2)

March 2002

- Bernstein's article "discovered" during *Financial Cryptography Conference*
- Informal panel devoted to analysis of consequences of the Bernstein's discovery
- Nicko Van Someren (nCipher) estimates that machine costing \$ **1 billion** is able to break **1024-bit RSA** within **several minuts**

---

---

---

---

---

---

---

---

### Bernstein's Machine (3)

March 2002

- **alarming voices** on e-mailing discussion lists calling for revocation of all currently used 1024-bit keys
- **sensational articles** in newspapers about Bernstein's discovery

---

---

---

---

---

---

---

---

### Bernstein's Machine (4)

April 2002

**Response of the RSA Security Inc.:**

Error in the estimation presented at the conference; according to formulas from the Bernstein's article machine costing \$ **1 billion** is able to break **1024-bit RSA** within **10 billion** x **several minuts** = **tens of years**

According to estimations of Lenstra i Verheul, machine breaking **1024-bit RSA** within **one day** would cost \$ **160 billion** in 2002

---

---

---

---

---

---

---

---

### Bernstein's Machine (5)

**Carl Pomerance, Bell Labs:**

„...fresh and fascinating idea...”

**Arjen Lenstra, Citibank & U. Eindhoven:**

„...I have no idea what is this all fuss about...”

**Bruce Schneier, Counterpane:**

„ ... enormous improvements claimed are more a result of redefining efficiency than anything else...”

---

---

---

---

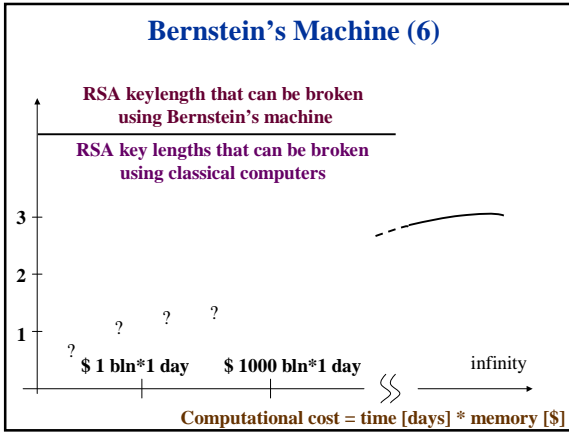

---

---

---

---

### Bernstein's Machine (6)

---

---

---

---

---

---

---

---

### RSA Challenge

Lentgh of N in bits	Length of N in decimal digits	Award for factorization
576	174	\$10,000
640	193	\$20,000
704	212	\$30,000
768	232	\$50,000
896	270	\$75,000
1024	309	\$100,000
1536	463	\$150,000
2048	617	\$200,000

---

---

---

---

---

---

---

---

**Estimation of RSA Security Inc. regarding  
the number and memory of PCs  
necessary to break RSA-1024**

**Attack time:** 1 year

**Single machine:** PC, 500 MHz, 170 GB RAM

**Number of machines:** 342,000,000

---

---

---

---

---

---

---

---
