

Normal distribution table

Description: This table provides the area (probabilities) for the normal distribution. The areas listed are those *less than* the z values given along the sides and top.

To get areas (probabilities):

1. Locate the first two digits of your z -value on the sides of the table, and the third digit off the top of the table.

For example, you want to find the area (probability) less than $z = 1.45$.

Locate the second part of the table (for positive z values), and go down the side until you locate 1.4 (about a third of the way down the page).

Now look at the top of the table. Move over to the 6th column, which is labeled 0.05 at the top.

The number where the row and column intersect in the table reads 0.9265.

In other words, $Pr\{Z \leq 1.45\} = \mathbf{0.9265}$.

To get quantiles (percentiles):

1. This is basically reverse lookup. Take your quantile (percentile) and go into the body of the table.
2. Find the closest number to the quantile (percentile) that you want.

If your percentile is exactly between two numbers on the table, just pick one and move on.

3. Read the z -value off the side and top of the table.

For example, you want to find the z value for the 90th percentile:

Go into the body of the table (don't use the numbers along the side or top) and find the number closest to 0.90.

You find this is 0.8997 (about a third of the way down on the right side of the 2nd page of the table).

Now look along the side and read 1.2.

Then go up from 0.8997 and read the third digit to get 0.08

In other words, you have $Pr\{Z \leq \mathbf{1.28}\} \approx 0.9000$.

Table 2. Normal-distribution table (negative z values).
